

Workshop

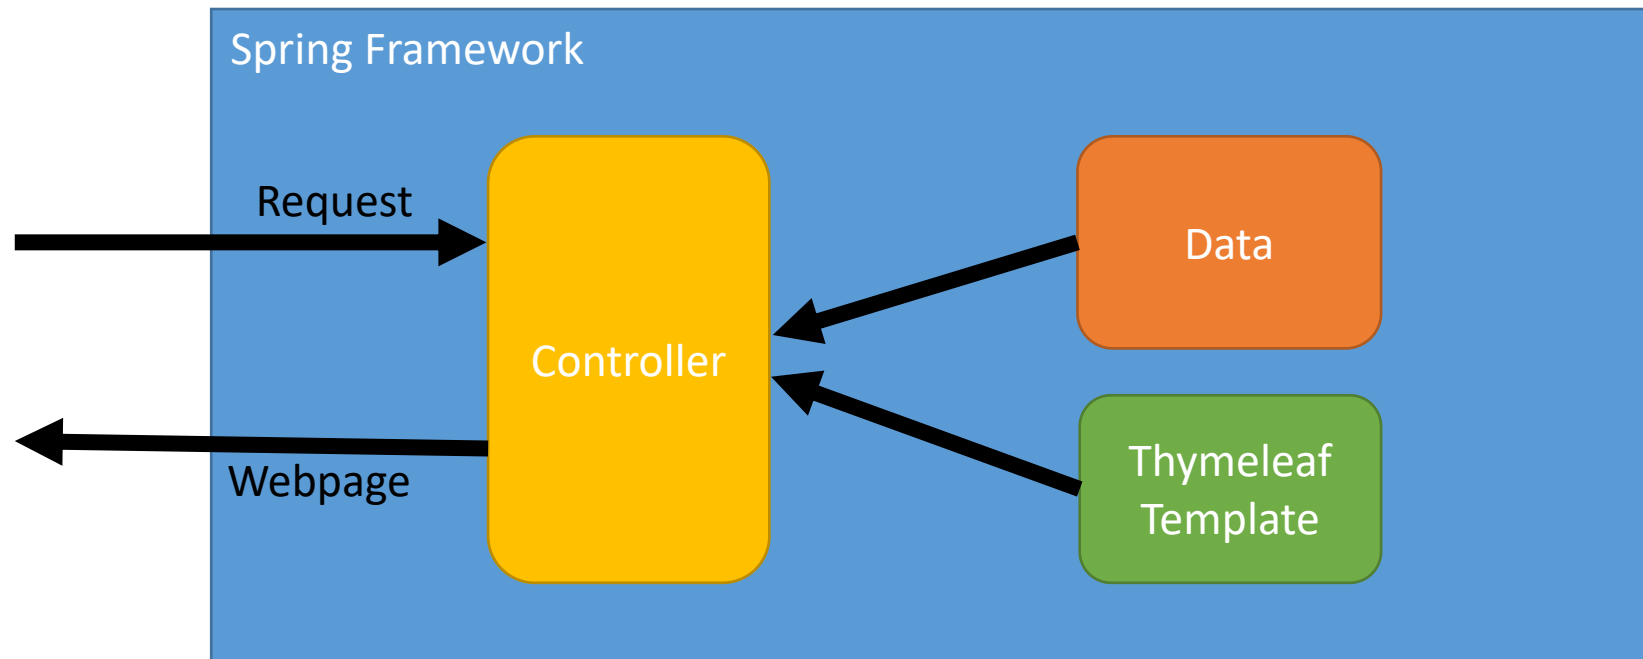

Webapp Development

Using Spring Boot MVC

Today's Topic

- Add a webpage to the project using Thymeleaf templating Engine

What is MVC?

Add a simple Home Page

- Reconfigure pom.xml
 - *spring-boot-starter-thymeleaf*
- Add a html file to /resources/templates folder.
- Add a Controller object to the project.
- Use RequestMapping and GetMapping to map the request to the Java method.
- Return a webpage to the request.

Passing Data using Model object

- Use `addAttribute()` of the Model object to transfer data to the webpage.
- Access to model attribute in the HTML template using `${}`.

Variable Expressions: `${...}`

Selection Variable Expressions: `*{...}`

Message Expressions: `#{...}`

Link URL Expressions: `@{...}`

Fragment Expressions: `~{...}`

Add a Hero List Page

- Add a GetMapping to the controller to map “/all” endpoint to a Java method. Return a Hero List Page with a model of list of heroes.
- Create a new HTML template for Hero List Page. Use th:each property in <tr> to iterate the list.

Create a Add Hero Page

- Add a GetMapping to the controller to map “/add” endpoint to a Java method. Return an Add Hero Page with a new empty model.
- Create a new HTML template for Add Hero Page.
 - Use th:object property to bind the <form> to the model.
 - Use th:field property to bind the <input> element of the <form>.
 - Use th:action to set the endpoint to the POST request.
- Add a PostMapping to the controller to map “/add” endpoint.
 - This endpoint access the data from the HTML using ModelAttribute.
 - The endpoint update the database and return a response web page.

th:action="@{url}"
th:field="{name}"*

th:object="\${object}"
