

Module Introduction

CPT202 Software Engineering Group Project

Soon Phei Tin, Chengtao Ji, Nanlin Jin

Aims of the module

- Students will work in groups of seven to nine to produce a working Webapp system.
- The aims of the module is to provide students with
 - the experience of group working.
 - the experience of all aspects of the development of moderately sized software system.
 - the preparation for the individual projects in the final year
 - the opportunity to consolidate material from the first semester of the third year

Learning Outcomes

- A. Work as part of a development team demonstrating effective communication and interpersonal skills to design and develop a software system.
- B. Demonstrate an understanding of the software development process including the principal methods and issues involved in deploying systems to meet business goals.
- C. Specify the requirements of a software system.
- D. Understand the role of properly written documentation in the process of software development.
- E. Recognize the legal, social, ethical, and professional issues involved in the development and deployment of a software system.

Methods of Learning and Teaching

- Self and peer guided learning within a tightly defined framework
- Lectures will be given at the beginning of the module. Thereafter, focus will shift to consulting students' project.
- Students will form group of seven to nine, and thereafter will be expected to work largely autonomously
- The project will carry out following Scrum framework. The development process will be reviewed and assessed by staff.
- Staff will be available on an 'as needed' basis to offer support, guidance and to arbitrate any difficulties.

Syllabus & Teaching Plan

- Introduction to the scrum framework; team collaboration and project source code management; continuous deployment; requirements specification; software development; software testing, report writing, project misc.
- Lecture material will be spread over the semester, but mostly focus on the beginning of the semester.
- Students will be expected to give a presentation of their project as it is developed. Students must be prepared to present at any time during the lecture.

Project Setup

Team Setup

- Each team consist of 7 to 9 students
- Team members must discuss and agree on a team leader
- Name your Team
- Use “Team Forming” link on LM to form your team. The deadline is on 21st Feb 2025 23:59
- Random allocation for students without a team will take place after the deadline. All teams and students must comply to the random allocation

Project

- Your team will be given a vague specification and is expected to deliver a software.
- Each team will be randomly assigned to one of 3 projects.
- The project descriptions are deliberately given in the form of simple customer specifications, which (as in the real world) are incomplete and often ambiguous.
- Most of the detail customer specifications can be based on your logic and real-life experience and should be made in your team meetings.

What action you need to take?

1. Form your team.
2. Discuss and decide a team leader for your team.
3. Read up the requirement of all Assignments.

What is your timeline?

Week	Task
1	Group Forming
2	Project Allocation Publishing Coursework
5	Coursework 1 Due Date Commencing Sprint 1
7	Commencing Sprint 2
9	Commencing Sprint 3
10	Coursework 2 Due Date
13	Coursework 3 Due Date
